Interview preparation - Senior Frontend Engineer

What to prepare

Please choose one project or feature you are particularly proud of that demonstrates your hands-on frontend development and attention to user experience. Ideally, this will involve React and TypeScript.

It could be a complete application, a substantial feature, a component library, or an improvement to an existing interface. Choose something you know well enough to discuss the details, decisions and trade-offs.

Prepare an approximately 15-minute walkthrough covering:

- **The problem and context.** Who were the users, what were they trying to achieve, and what made the work challenging?
- **Your personal contribution.** What were you responsible for, who else was involved, and which decisions or improvements were yours?
- **The experience you created.** Show a representative user journey and explain the design and interaction details you are proud of. Before-and-after examples are particularly useful.
- **The engineering behind it.** Explain the important frontend decisions, such as component structure, state handling, reusable patterns, performance or testing.
- **The outcome and your reflections.** What improved, how did you assess the result, and what would you approach differently now?

The walkthrough will be followed by a discussion in which we explore selected details together. You do not need to prepare a presentation for the full hour.

A working application, screenshots, a recording, Figma designs, selected code or a simple architecture sketch are all suitable. A slide deck is optional, and no new coding task is required.

Please only share material you have permission to disclose. Anonymised examples or a verbal explanation are welcome where the work is confidential. We do not require access to private repositories, customer data or internal systems.

Interview format

The interview will include 15 minutes of introductions and role context, 60 minutes for your walkthrough and discussion, and 15 minutes for your questions and closing.
